Color	Label	*Description*		Color	Label	*Description*
	01 type: bug	*something does not work*			21 status: confirmed	*issue was read and got confirmed*
	02 type: regression	*missing stuff from former version*			22 status: in-progress	*somebody works on that issue*
	03 type: feature (plip)	*really new stuff or major change*			23 status: testing	*for this PR a PR test or similar is running, waiting for results*
	04 type: enhancement	*making existing stuff better*			24 status: ready	*for a PR it means, tests passing, merge me asap*
	05 type: question	*discussing*			25 status: deferred	*work on issue is scheduled for future*
	06 type: accessibility	*proposed!*				
					31 needs: help	*anybody: please help with this issue*
	11 prio: blocker	*need to be fixed immediatly*			32 needs: review	*this issue needs review, mostly PRs*
	12 prio: high	*High priority*			33 needs: docs	*this issue implies missing documentation*
	13 prio: normal	*Normal priority*			34 needs: tests	*this issue implies missing tests*
	14 prio: low	*Low priority*			35 needs: rebase	*this PR needs a rebase*
					36 needs: cla	*submitter has not signed the contributor license agreement*
	41 lvl: easy	*beginner skills needed*			37 needs: release	*a release is needed*
	42 lvl: moderate	*fair insight needed*				
	43 lvl: complex	*for wizards*			51: target: patch	release target is a patch release with a bugfix (see http://semver.org)
					52: target: minor	release target is a minor release with a new feature (see http://semver.org)
					53: target: major	release target is a major release with breaking changes (see http://semver.org)
					99 tag: {others}	free form labels

Explanation:

	number-prefix	we need this to have a sanely sorted list of the issues in github, the widgets sorts them alphabetically. otherwise selecting them is a large headache
	group-prefix	it makes things more clear to prefix
	color	while the main types should be easily to differenciate, the other groups are base color plus gradient
	open/closed	is handled by github already!
	the tag: thing	we have a bunch of custom tags around, and this makes sense. they get their own namespace and can be labled free after the prefix
	issue vs. Pull Request	Dont make a difference here, Github does it already. A PR is usally a 01-04.
	state vs. status	For the non-native-english folks: http://english.stackexchange.com/questions/12958/status-vs-state

How to get this on all issue trackers?

There is already a script that takes care (plone.github). Also migration form old labels to new labels happens automatically.
For new repositories the script just need to be re-run. Github-API FTW!
